

# Proxychains Quick Reference

For Ethical Hackers

---

## Installation & Setup

Install (if needed):

```
bash  
  
sudo apt-get install proxychains4 tor
```

Start Tor service:

```
bash  
  
sudo service tor start  
sudo service tor status
```

---

## Configuration

Edit config file:

```
bash  
  
sudo vim /etc/proxychains4.conf
```

Key Settings:

```
# Chain Types (uncomment one)  
dynamic_chain    # Skip dead proxies  
# strict_chain   # All proxies must work  
# random_chain   # Random proxy selection  
  
# DNS Protection  
proxy_dns        # Prevent DNS leaks
```

## Add proxies at bottom:

```
socks5 127.0.0.1 9050    # Tor default
socks5 51.15.85.204 1080 # Custom SOCKS5
http 203.0.113.5 8080   # HTTP proxy
```

---

## Usage

### Launch applications:

```
bash

proxychains4 firefox
proxychains4 curl ifconfig.me
proxychains4 nmap -sT -Pn target.com
```

### Check external IP:

```
bash

proxychains4 curl ifconfig.me
```

---

## Verification

### Test anonymity:

- Visit [check.torproject.org](https://check.torproject.org)
  - Visit [dnsleaktest.com](https://dnsleaktest.com)
  - Compare IP before/after proxychains
- 

## Troubleshooting

### Tor not running:

```
bash
```

`sudo service tor start`

### **Connection denied:**

- Update proxy list
- Use `dynamic_chain` mode
- Check proxy availability

### **DNS leaks:**

- Ensure `proxy_dns` is uncommented
- Test with `dnsleaktest.com`

### **Slow performance:**

- Use fewer proxies
- Switch to paid proxies
- Use SOCKS5 over HTTP when possible
